

Basic Principles for Use of Dental Cone Beam CT

Consensus Guidelines of the European Academy of Dental and Maxillofacial Radiology

January 2009

The Academy

The objective of the European Academy of DentoMaxilloFacial Radiology (EADMFR) is to promote, advance and improve clinical practice, education and/or research specifically related to the specialty of dental and maxillofacial radiology within Europe, and to provide a forum for discussion, communication and the professional advancement of its members.

EADMFR has a membership exceeding 300 individuals whose special interest is imaging of the dental and maxillofacial region. It is multi-disciplinary, including dental radiologists, medical physicists, radiographers and scientists. It includes both academics (teachers and researchers) and clinicians.

The Guidelines

The introduction of Cone Beam Computed Tomography (CBCT) represents a radical change for dental and maxillofacial radiology. The three-dimensional information appears to offer the potential of improved diagnosis, for a wide range of clinical applications and usually at lower doses than with "medical" multislice CT. Usually, however, CBCT gives increased radiation doses to patients compared with conventional dental radiographic techniques. While there is a rapidly accumulating literature on CBCT, there are no current evidence-based guidelines on its use and there is a risk of inappropriate examinations being performed. The latter is a particular concern where CBCT equipment is sited in primary dental care without the skills of radiology specialists.

EADMFR recognised an urgent need to set standards for CBCT use. This need has also been recognised by the European Atomic Energy Community's Seventh Framework Programme (Euratom FP7, 2007-11), which has cofunded a research project "SEDENTEXCT" (Safety and Efficacy of a New and Emerging Dental X-ray Modality) in 2008 which aims to acquire key information necessary for sound and scientifically based clinical use of Cone Beam Computed Tomography (CBCT). As part of this aim, the project has set an objective of developing evidence-based guidelines for dental and maxillofacial use of CBCT.

In the absence of a satisfactory volume of evidence upon which detailed guidelines can be currently devised, some basic principles can be based upon existing sources. These include fundamental international principles, EU Directives^{1,2} and previous Guidelines³. In view of the mutual aims of EADMFR and SEDENTEXCT, a decision was taken to collaborate in the development of a set of "Basic Principles" for the use of dental CBCT.

A Guideline Development Panel was formed to develop a set of draft statements using existing EU Directives and Guidelines on Radiation Protection. These statements were revised after an open debate of attendees at the 11th EADMFR Congress on 28th June 2008. A modified Delphi

procedure was then used to present the revised statements to the EADMFR membership, utilising an online survey in October/November 2008. Consensus of EADMFR members, indicated by high level of agreement for all statements, was achieved without a need for further rounds of the Delphi process.

A set of 20 "Basic Principles" on the use of Dental CBCT have been devised. They will act as core standards for EADMFR and, it is hoped, will be of value in national standard setting within Europe for dentists, dental specialists and equipment manufacturers.

Lennart Flygare, President EADMFR
Kostas Tsiklakis, Immediate Past President EADMFR
Eric Whaites, Founding President EADMFR
Keith Horner, Chair, EADMFR Selection Criteria and Radiation Protection
Committee and SEDENTEXCT project Co-ordinator
