

# Health economics of CBCT

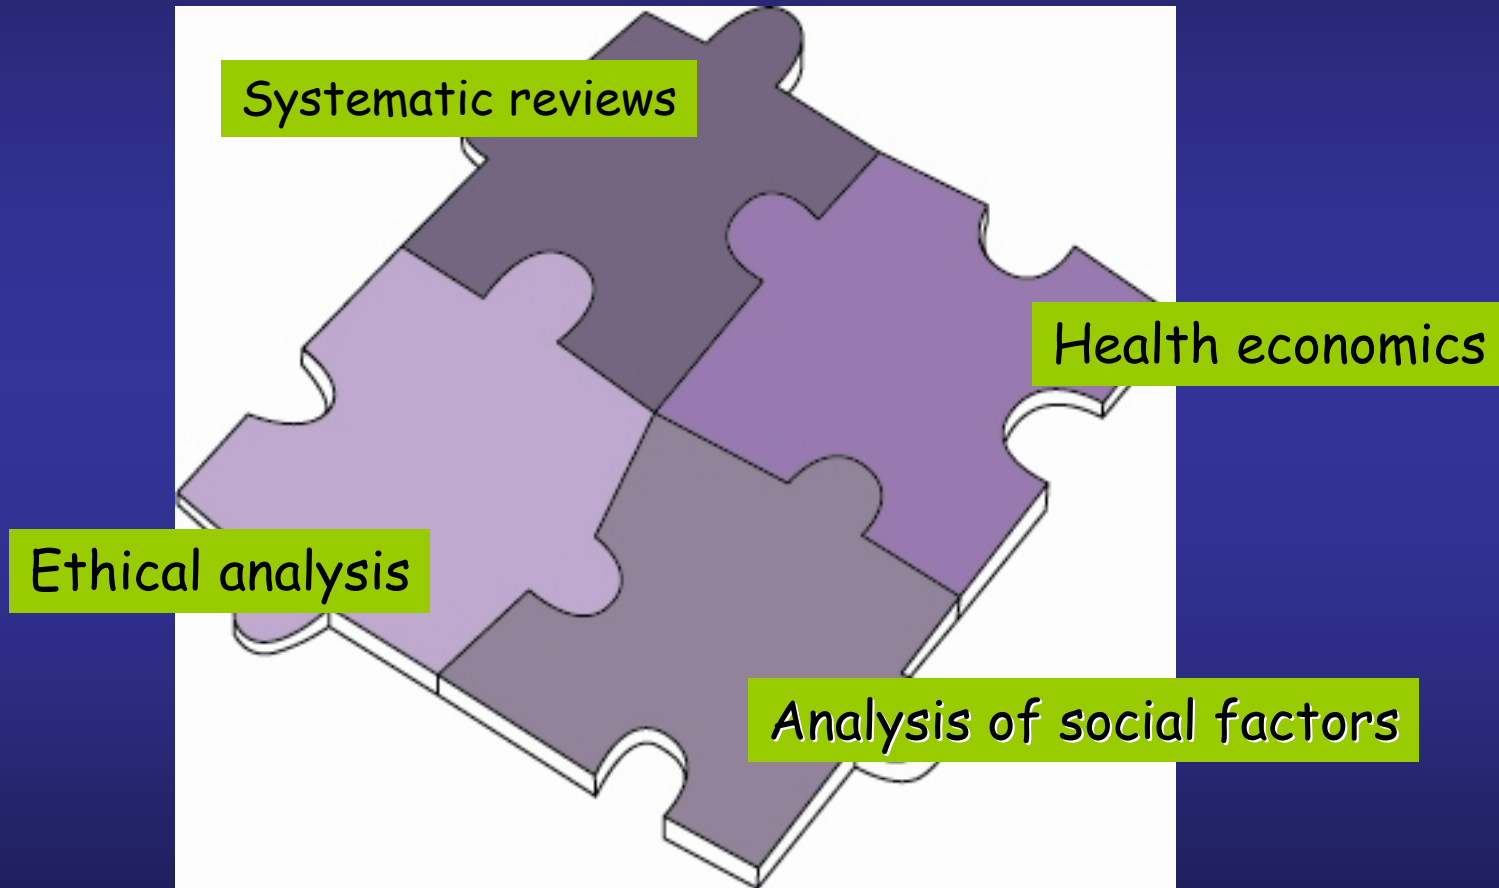

The gain of CBCT in terms of efficacy

SEDENTEXCT

Workshop on dental Cone Beam CT

# Health Technology Assessment

# Economical evaluation

“the comparative analysis of alternative courses of action in terms of their costs and consequences”

Drummond et al 2005

Cost-effective analysis

Analysis of costs and outcomes of alternative methods may differ in magnitude

Cost-minimization analysis

Outcomes of diagnosis/treatment are identical

Cost-utility analysis

The quality of health outcome following diagnosis/treatment – health related quality of life studies

Cost-benefit analysis

Consequences are expressed in monetary units

# Why is it important?

Resources in health care are limited.

In choosing to use resources in one way one forgoes the opportunity to use the same resources in another competing way.

“There is a growing awareness that tests should be evaluated not on their intrinsic qualities (essentialism) but based on their **consequences for patients’ health and the use of health care resources** (consequentialism). Acceptable **diagnostic accuracy**, though usually desired, is generally **not sufficient** for demonstrating benefits from testing.”

Bossuyt PMM *EVIDENCE-BASED MEDICAL TESTING*

*Report prepared for the Dutch Health Care Insurance Board 2010*

Continued...

- Economical evaluations that weight costs and effects of alternative interventions are particularly important in emerging (“creeping”) technologies to avoid inappropriate and excessive use

# Research questions

How much does an examination with CBCT cost compared with conventional methods?

Which information will be gained from CBCT examinations compared with conventional diagnostic imaging methods in dentistry?

# COST- EFFECTIVENESS

```
graph TD; A[COST-EFFECTIVENESS] --> B[COST ANALYSIS]; A --> C[ANALYSIS OF CONSEQUENCES]
```

COST ANALYSIS

ANALYSIS OF  
CONSEQUENCES

THE **ONLY** PUBLICATION OF  
Diagnostic **Imaging** Methods  
IN ORAL HEALTH CARE  
presenting an evaluation of efficacy and costs

Norlund A, Axelsson S, Dahlén G, Espelid I, Mejare I, Tranaeus S, Twetman S. Economic aspects of the detection of occlusal dentine caries. *Acta Odontol Scand* 2009;67:38-43.

Conventional  
method

New method

SEDENTEXCT

Workshop on dental Cone Beam CT

# A model for cost calculations of methods used in oral health care has to take into account

- **Direct costs**; capital costs, consumables and labour costs
- **Indirect costs**; patient time and costs

All items have to be **identified** (what),  
**measured** (how much/how many)  
and **valued** (unit costs)

The model was applied on different clinical situations in different health care systems

SEDENTEXCT

Workshop on dental Cone Beam CT

- The estimates for direct and indirect costs varied between the health care systems
- The variation in direct costs was mainly due to the capital costs for the CBCT-equipment (range 10.67 – 58.94 €)
- Variation in indirect costs were mainly due to examination fees (range 0 – 102.02 €). The examination fee varied according to clinical conditions within the same health care system
- A cost evaluation of a dental radiographic method cannot be generalised from one health care system to another but must take into account the specific circumstances

# Costs of CBCT compared with costs for a conventional method

Application of the model for cost-analysis allowed us to compare each resource used to perform examinations of the two methods. The mean total cost per examination for the **new method** was **128.38€** and **81.80€** for the **conventional method**, resulting in an **incremental cost** per examination of the new method of **46.58€**.

# RESULTS

Five observers assessed images from 60 maxillary canines with eruption disturbances

Significant differences between observers in **time for assessment** being longer for assessing CBCT images and in **confidence**, being higher for the new method

# Root resorptions of neighbouring teeth

In **66%** of the images five observer agreed on **root resorption** being present or not on the **lateral incisor** and made the same assessment with both methods.

For rootresorption on the **first premolar** the corresponding figure was **90%**

# Clinicians

Five orthodontists assessed radiographs of eight patients where basic data were the same for all patients but position of the maxillary canine and amount of resorption on one of the neighbouring teeth differed as observed with conventional or new method

### **Setting A**

Information about the patient

Photo documentation of plaster model

Radiological report

Access to panoramic and intraoral radiographs

### **Setting B**

Information about the patient

Photo documentation of plaster model

Radiological report

Access to panoramic and CBCT images

8	6	6	6	6	6

SEDENTEXCT

Workshop on dental Cone Beam CT

The change of treatment between the two settings in 4 of 7 cases did not depend on the different radiological reports, which in those cases were the same for the new and conventional method.

The new method cost 46.58€/examination  
(Figures from Malmö, Sweden)

In the context of maxillary canines with eruption disturbances you will get a change in 3 out of 40 treatment decisions
